Native Seed Balls
(Seed Bombs)

BENEFIT TO WILDLIFE
Native seeds grow into native plants. Native plants benefit animals by providing food in the form of seeds, nuts, fruit, and foliage. Birds, and other animals, also feed on the caterpillars of moths and butterflies that rely on specific native plants for foraging and reproduction. Grow native and support the food web from the bottom up!

INSTRUCTIONS
Throw seed balls in areas at home or in your community where the ground has been disturbed and can be seen—for example, abandoned lots or recently turned gardens. These can be thrown in the early winter or early spring, but should not be thrown if the ground is covered in snow.
